

## Size Guide

### HOW TO GET THE RING SIZE:

- 1 Take a narrow strip of paper or thread no more than 1 mm thick.
- 2 Wrap the desired finger so that the material sits tightly, but does not squeeze it.

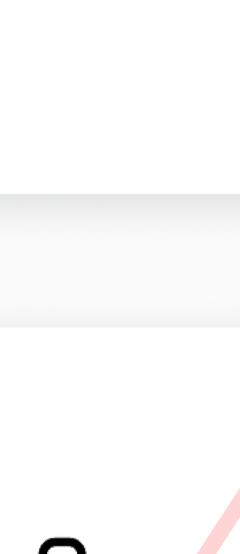

- 3 Use the pen to mark the point at which the resulting circle closes in.
- 4 Place the thread or strip on a flat surface and measure the resulting segment with a ruler.

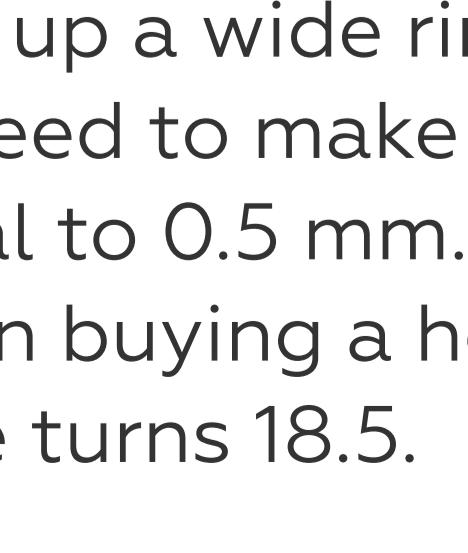

- 5 Compare the length of the resulting circle using the table. If the indicator is between two sizes, choose the larger one. In order not to make a mistake with the choice of the ring size, pay attention.

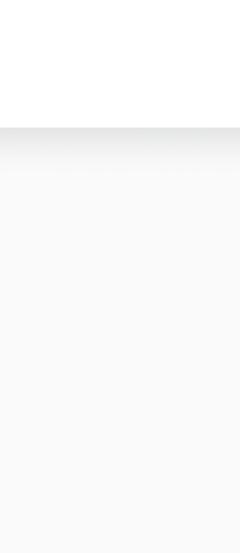

**i** IN ORDER NOT TO MAKE A MISTAKE WITH THE CHOICE OF THE RING SIZE, PAY ATTENTION TO SOME FINER POINTS:

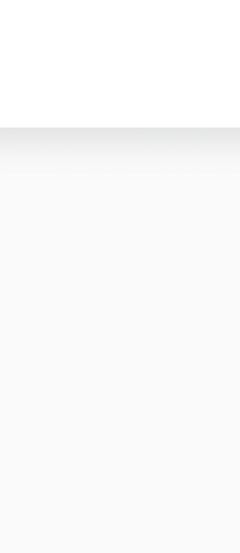

Our fingers can change their thickness for a lifetime, so even if you know your ring size, we advise you to double-check it.

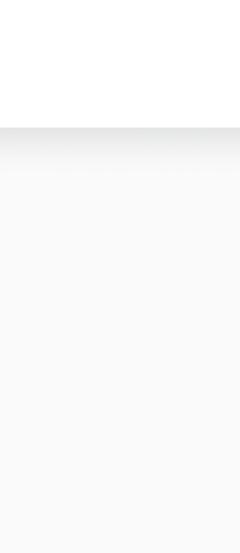

The size of the fingers on the left and right hand may differ, keep this in mind when choosing a wedding band.

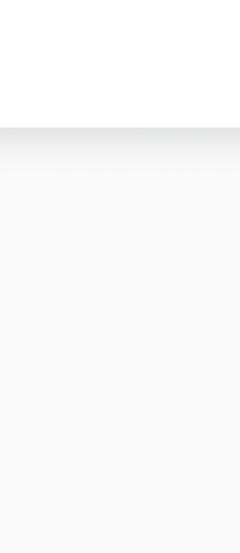

The ring should fit snug enough around the finger, but at the same time, it should slide easily over the joint. If the joint is wider than the finger itself, focus on the diameter of the joint when measuring.

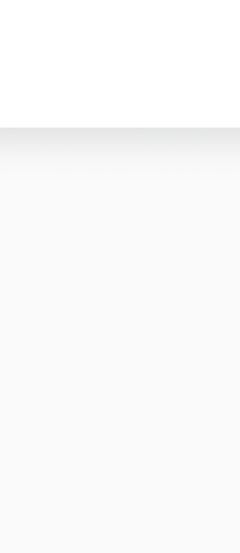

We recommend measuring your finger three times - in the morning, afternoon and evening, because the size may change slightly during the day. If the indicators match at least twice, then the right size has been found.

We recommend measuring the size of the finger at room temperature because too cold or too hot air can affect its thickness.

It's no good to take measurements immediately after sleep or physical exertion – at this time the fingers may become swollen.

It is necessary to take into account the thickness of the future ring. If you need to size up a wide ring (more than 7 cm), you need to make a small margin equal to 0.5 mm. That is, when buying a heavy ring, the 18th size turns 18.5.
